RESULT 1 AAD33667 K K K K K K K X E X T X A C X 01-JUL-2002 (first entry) AAD33667 standard; cDNA; 1874 BP Human TRICH-22 cDNA.

Human; transporter and ion channel; TRICH-22; transport disorder; angina; amyotrophic lateral sclerosis; cystic fibrosis; neuromuscular disorder; cardiac disorder; polymyositis; diabetes; neurological disorder; cancer; depression; schizophrenia; anaemia; Wilson's disease; Cushing's disease; cell proliferated disorder; infertility; arteriosclerosis; gene therapy; alzheimer's disease; Parkinson's disease; Huntington's disease; allergy; and the control of acquired immune deficiency syndrome; myasthenia gravis; multiple sclerosis; immunological disorder; metabolic scleroderma

```
mycarditis, prostate cancer, cardiac disorders associated with

ctransport e.g. polymyositis, bradyarrythmia, dermatomyositis, angina,

cneurological disorders associated with transport e.g. amnesia, bipolar

cdisorder, depression, Tourette's disorder, schizophrenia, other disorders

cassociated with transport e.g. neurofibromatosis, sickle cell anaemia,

cwilson's disease, cataracts, infertility, hyperglycaemia, hypoglycaemia,

cyoitre, Cushing's disease, hypercholesterolaemia and cystinuria. Cell

cyoitre, Cushing's disease, hypercholesterolaemia and cystinuria. Cell

cyoitre, Cushing's disease, hypercholesterolaemia and cystinuria.

cell

cyoitre, Cushing's disease, hypercholesterolaemia and psoriasis.

carteriosclerosis, atherosclerosis, bursitis, hepatitis and psoriasis.

cushem and other certorosis, dementia and other extrapyramidal disorder,

conversellar, disorder, prion disease, metabolic disease of the nervous

system and other developmental disorders of the central nervous system,

                                                                                                                                                                                                                                                                                                   designated TRICH and nucleic acid molecules encoding such polypeptides. TRICH sequences are useful for diagnosis, treatment and prevention of transport, muscle, neurological, immunological and cell proliferative disorders. Transport disorders include akinesia, amyotrophic lateral sclerosis, ataxia telangiectasia, cystic fibrosis, Becker's muscular dystrophy, diabetes mellitus, diabetes insipidus, myasthenia gravis, myocarditis, prostate cancer cardiac disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cardiac myopathy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a human ataxia protein. The ataxia protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying and characterizing genetic defect involved in the disorders and diseases related to ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   linked to the tac promoter, a ribosome binding sequence, the E. coli outer membrane protein OmpF signal peptide coding sequence and a sequence coding for the N-terminal extracellular site of either the gamma-aminobutyric acid (GABA) A receptor alpha-subunit or the glycine receptor alpha-subunit. This expression plasmid can be used to transform E. coli to produce an N-terminal extracellular site-protein of ion channel direct binding type receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vesospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to Rhipicephalus sanguineus (brown dog tick)
--glutamate-gated chloride channel proteins (GluCl1 and GluCl2)
and nucleic acid molecules encoding such proteins. GluCl channel
proteins are useful for identifying modulators. The compounds
identified as modulators are useful for insecticidal, mitacidal
and/or nematocidal treatment for use in animal and human health
and/or crop protection. The compounds are also useful in screening
for and selecting compounds active against parasitic invertebrate
species relevant to animal and human health, including worms,
fleas, ticks, mites and lice. Heterologous cell lines expressing
functional GluCl1 and GluCl2 channel functional forms are useful
for establishing functional or binding assays to identify novel
GluCl1 channel modulators. The present sequence is R. sanguineus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel L-glutamate-gated chloride channel proteins from Rhipicephalus sanguineus for identifying compounds which modulate the channel proteins, which are useful as insecticides, anthelmintics and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     No.:

                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid encoding lepidopteran glutamate-gated chloride channels are a family of ligand-gated chloride channels unique to invertebrates. The DNA of the invention is used for recombinant production of lepidopteran glutamate-gated chloride channel and this is used, optionally in the form of membrane preparations or recombinant cells, in specific-binding or functional assays for identifying potential insecticides. The present sequence is HEGEZ clone CDNA encoding full insections.

                                                                                                                                                                                                                 The invention relates to nucleic acid encoding lepidopteran glutamate-gated chloride channel. Glutamate-gated chloride channels are a family of ligand-gated chloride channels unique to invertebrates. The DNA of the invention is used for recombinant production of lepidopteran glutamate-gated chloride channel and this is used, optionally in the form of membrane preparations or recombinant cells, in specific-binding or functional assays for identifying potential insecticides. The present sequence is Heliothis sp. HEG3E(4)-2 plasmid DNA used in the exemplification of the invention.

Note: This sequence SEQ.ID.NO.11 is stated to be similar to the sequence shown in sequence listing of the specification. However these sequences differ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAD26937

                                                                                                                                                                                                      DB:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a purified nucleic acid molecule encoding CC Dermancentor variabilis (DV) (American dog tick) ligand gated ion CC channel/L-glutamate gated chloride channel (IGIC/GluCl) protein.
CC LGIC/GluCl DNA is useful for identifying a compound that modulates CC glutamate-gated channel protein activity and for identifying a modulator Of LGIC/GluCl DNA is used for establishing CC insecticidal activity for use in treating parasitic infections in humans CC insecticidal activity for use in treating parasitic infections in humans CC or animals, as hybridisation probes to isolate related genes from other CC organisms to establish additional pesticide drug screens and also used CI ncompetition binding experiments or for functional chloride channel CC assays to screen for compounds that activate, block or modulate the CC channel. Heterologous expression of LGIC/GluCl protein allows the CC pharmacological analysis of compounds active against parasitic CC invertebrate species relevant to animal and human health, especially in the treatment of tick infestations directly related to Dv. LGIC/GluCl CC modulators act as effective insecticidal, acaricidal, mitacidal and/or crop compounds active against parasitic compounds act as effective insecticidal, acaricidal, mitacidal and/or crop compounds carried to the treatment of the modulators are useful for treatment or diagnosis of compounds carried to the treatment or diagnosis of compounds carried to the treatment or crop compounds carried to the treatment or diagnosis of compounds carried to the treatment or diagnosis of compounds carried to the channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel purified nucleic acid molecule encoding Dermancentor variabilis ligand gated ion channel/L-glutamate gated chloride channel protein, useful for identifying modulator compounds that are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; Page 51-52;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2001-662966/76

                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to gamma-aminobutyric acid (GABA)-gated chloride channels and their corresponding nucleic acid molecules. GABA-gated chloride channel proteins and DNA's are useful for preventing and treating tick infestation, particularly in humans, dogs, cattle, horses, deer, or other wild or domesticated animals. The nucleic acids are useful as hybridisation probes or Polymerase Chain Reaction primers for identifying the presence of Dermacentor variabilis GABA-gated chloride channel nucleic acid or DNA's encoding for a GABA receptor. The nucleic acids are also useful for the recombinant expression of D. variabilis GABA-gated chloride channel proteins exert toxic effects on other ticks or related parasites such as mites. The present sequence is Rhipicephalus sanguineus Glucl DNA probe which is used for cloning Dermacentor variabilis GABA-gated chloride
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
